

Fishing Frenzy

What is FishingFrenzy?

FishingFrenzy is a multiplayer game, a decentralized application based on smart contracts running in Ethereum blockchain.

Players can collect, fight and grow crypto fish tokens to dominate the "decentralized FrenzyVerse".

Each Fish has a unique name, a unique image and unique characteristics as a ERC-721 token stored in the Ethereum network that can be sold or transferred just like any other cryptocurrency.

How It Works ?

In the Game players will get initially a fish rod, through that rod we can fish in a pool. Currently we supported only three varieties of fishes , Common , Rare , Epic.

Players need to upgrade Fish rod to Catch Powerful Fishes,so we can sell it in market high price.

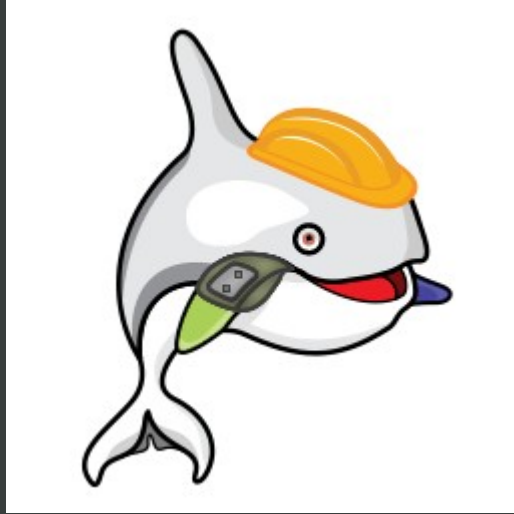

There is an ERC20 Token to recharge us to help further fishing or we can destroy fish to gain power.

Sample Fish Modals

Common

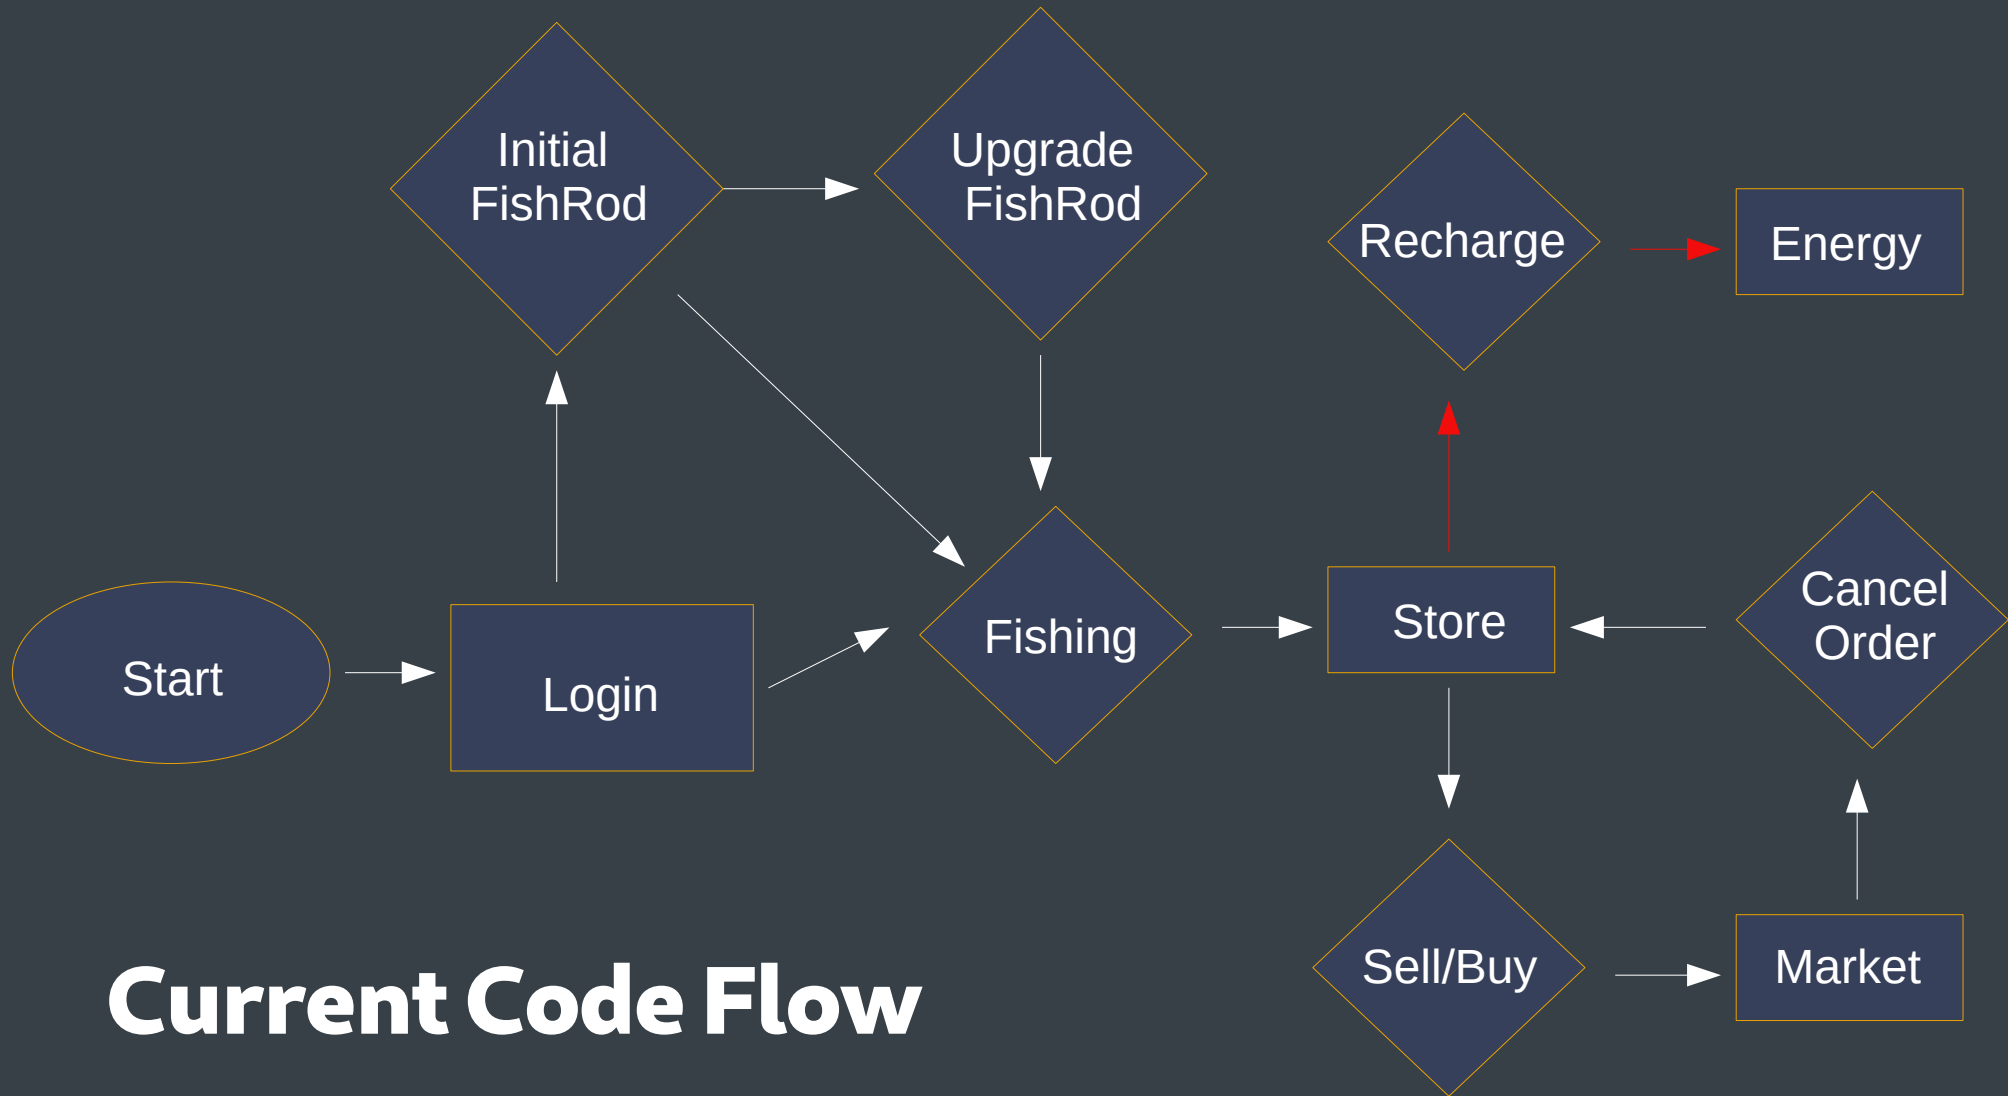

Rare

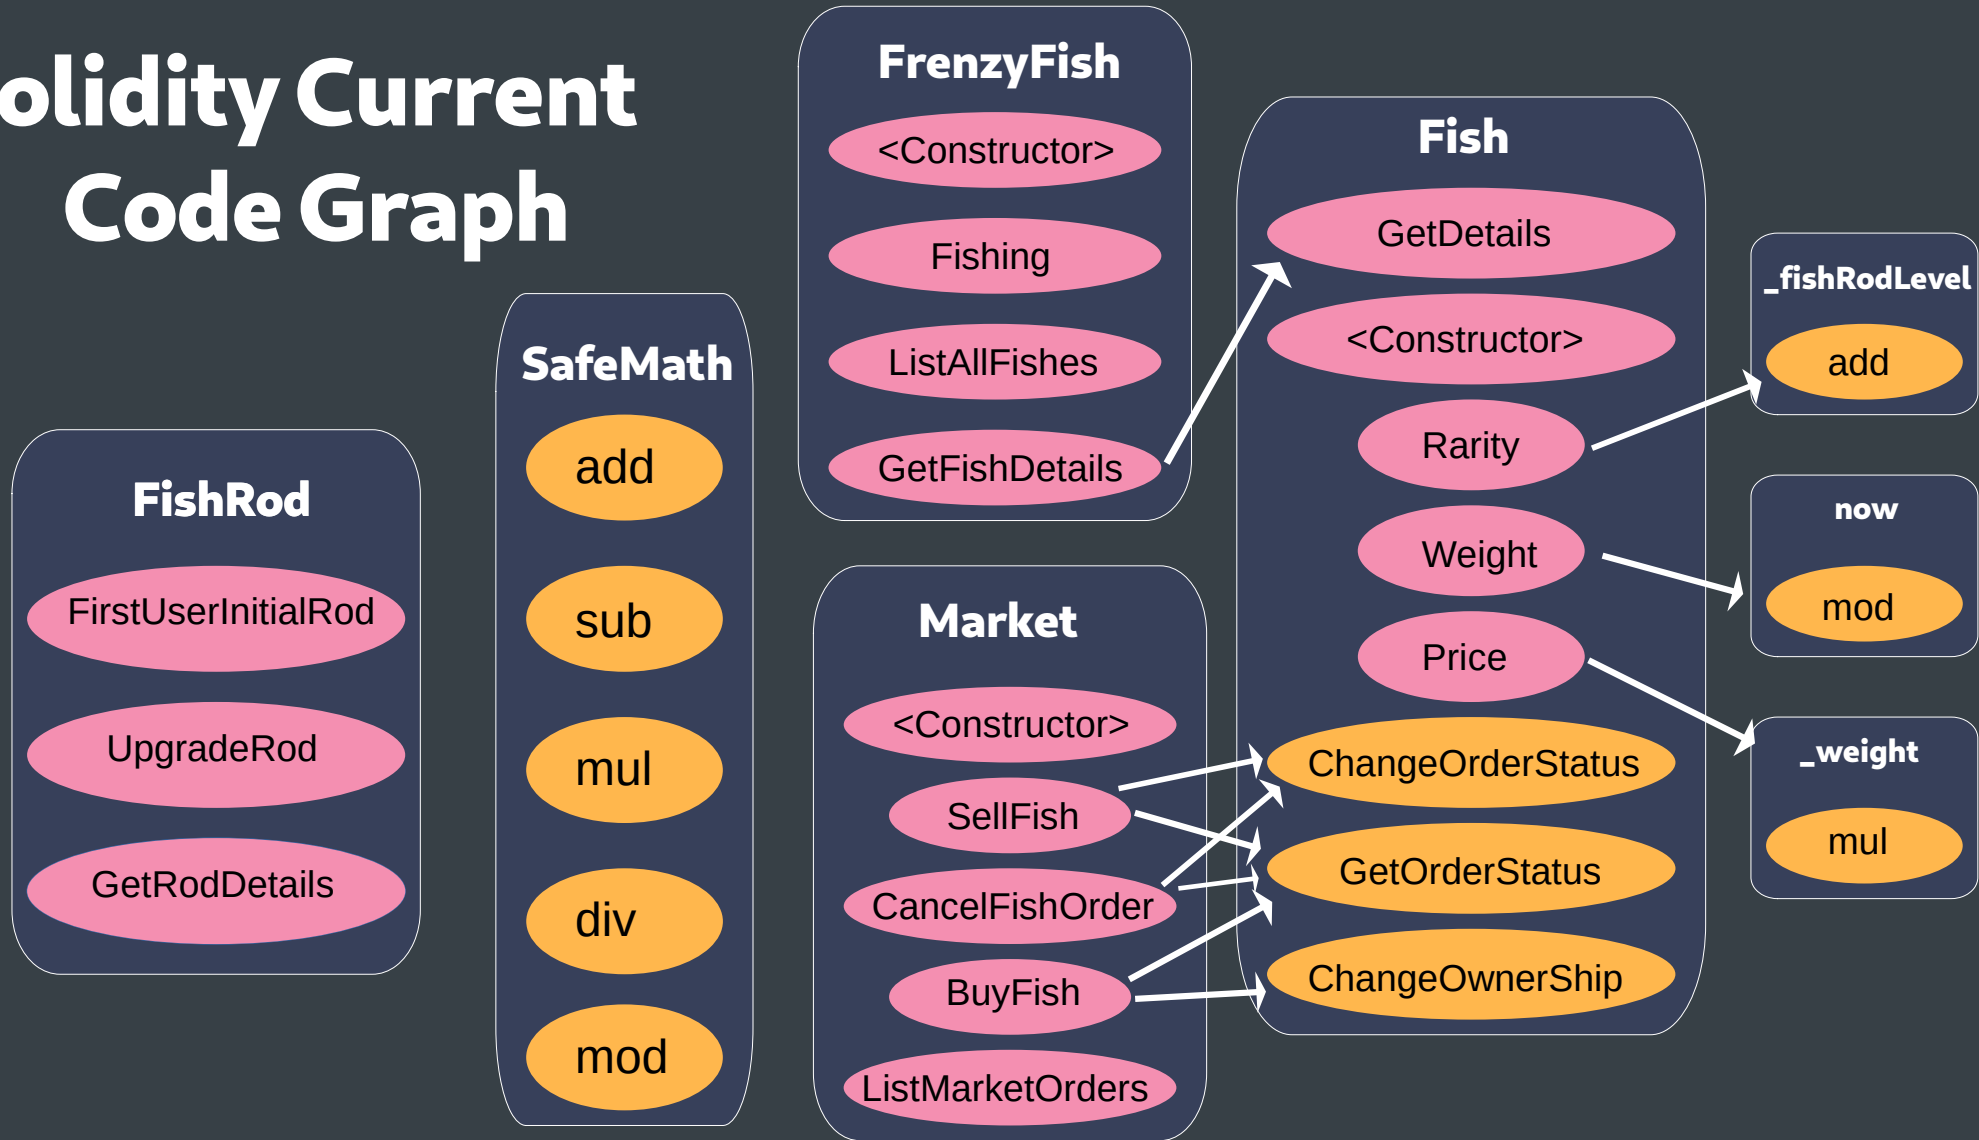

Epic

Using Third Party API
